# The U.S.-Chinese Trade War: An Event Study of Stock-Market Responses 

Peter H. Egger<br>(ETH Zurich, CEPR, CESifo, Wifo)<br>Jiaqing Zhu<br>(Guangdong University of Foreign Studies)

## The Paper Underlying My Talk

- CEPR Discussion Paper DP14164 (from this week).
- Presented at the Economic Policy October meeting at Helsinki.
- Awaiting final acceptance by Economic Policy.
- Will be advertised by a VoxEU Column (already submitted).

## Research Motives

- "Trade war" between U.S. and China is taking a toll everywhere.
- But quantifying cross-country impact on basis of solid statistical data will take years.
- Currently, cross-country stock-market data are among the few (immediately) measurable objects revealing hard signals about how investors view "trade war".

## Research Motives

Interesting questions:

- Does the "trade war" do its intended job?

Protect and promote domestic industry in targeted sectors.

- Are there unintended consequences? Effects on
- untargeted sectors;
- untargeted countries.
- How important are expected-retaliation and global-valuechain links between sectors and countries in shaping/counteracting effects? Overall effects may be beyond comprehension of politicians in charge.

## Related Literature

- Event studies on stock-market responses to PTAmembership announcements (Thompson, 1993, 1994; Rodriguez, 2003; Breinlich, 2014; and Moser and Rose, 2014) and Brexit vote (Breinlich, Leromain, Novy, Sampson, and Usman, 2018 and Davies and Studnicka, 2018).
- Work on "trade-war" effects on U.S. trade, prices, and welfare (Amiti, Redding, and Weinstein, 2019; Fajgelbaum, Goldberg, Kennedy, and Khandelwal, 2019).

## Related Literature

- Economic theory of trade wars (Grossman and Helpman, 1995; Harrison and Rutström, 1991; Lockwood and Wong, 2000) and associated empirical work on noncooperative tariffs (Ossa, 2014).

## This Paper

Estimate stock-price deviations from "normal market value" for

- each of $\mathbf{3 1 , 2 1 7}$ listed firms
- in 40 countries and territories and
- 30 (WIOD-aggregate) sectors
- around the sequence of 19 U.S.-China "trade-war" events between March 2018 and May 2019.

Consider event windows of -1 to +10 days around each individual event and pool data across events.

Direct (on U.S. and Chinese firms in targeted sectors) as well as indirect (global-input-output-linked) effects.

## This Paper

Methodology is a blend of

- event study;
- (treatment-and-control-group) average treatment effect estimation;
- difference-in-difference estimation techniques;
- continuous treatment effects studies (use of tariffs).

## Economic Theory on Protectionism

Here is what we teach students:
(i) protectionism is always bad (in terms of welfare) for small economies; and
(ii) modest degree of protectionism (i.e., tariffs that are not too high), may be positive for large economies.

Necessary conditions

- there is no retaliation and
- cross-border complementarities through the integration in global value chains are absent.

## Reality of Protectionism

(i) There is always retaliation!
(ii) And it is expected (by business).
(iii) And global value chains are ubiquitous (domestic inter-sector dependencies plus international country-sector-with-countrysector interdependencies).
(iv) Trade-war tariffs are never modest (see U.S.-China).
(v) What exactly does it mean for a country to be large? (Everybody agrees on Austria and Liechtenstein, but are UK, Germany, China, or U.S. large in that they dominate world prices sufficiently?)

## Hypotheses

With (expected) retaliation and strong complementarities

- "trade-war" tariffs may exert negative effects even on targeted sectors;
- particularly ones which heavily rely on inputs from tarifftargeted foreign countries; expect negative effects on firms, which are more strongly affected by foreign retaliatory tariffs;
- effects on untargeted countries and sectors.

Figure 1. Chronology of the U.S.-China "Trade War"

## Research Design Graphically

Event on date e

Estimate explained and unexplained (abnormal; AR) stock-market returns for each
firm (over about 250 trading days)

Time measured in days t

Accumulate Ars
(to CARs) and estimate tariff effects for up to 10 days after e

## Research Design - Step 1

- Decompose daily stock-market returns of each company i on day $t$ around event date e into their systematic and their residual component:

FirmReturn $_{\text {ite }}=\alpha_{\text {ie }}+\beta_{\text {ie }}$ MarketReturn $_{\text {ite }}+\gamma_{\mathrm{ie}}$ EffExchRate $_{\text {ite }}+\varepsilon_{\text {ite }}$ over $\mathrm{t}=\left[\mathrm{T}_{\mathrm{e}}-610, \mathrm{~T}_{\mathrm{e}}-361\right]$
[End of estimation window for the last event considered is
December $31,2017 \Rightarrow$ prior to any events. 1 year $\approx 250$ trading days.]

## Research Design - Step 1

- Abnormal Returns (AR) for firm i, day $t$, and event e:

$$
\left.\begin{array}{l}
\mathrm{AR}_{\text {ite }}=\widehat{\varepsilon}_{\text {ite }}=\text { FirmReturn }_{\text {ite }}-\left(\widehat{\alpha}_{\text {ie }}+\widehat{\beta}_{\text {ie }} \text { MarketReturn }_{\text {ite }}+\right. \\
\hat{\gamma}_{\text {ie }} \text { EffExchRate } \\
\text { ite }
\end{array}\right)
$$

- Cumulative abnormal returns (CAR) for firm i, day s, and event e:

$$
\mathrm{CAR}_{\text {ies }}=\sum_{\mathrm{t}=\mathrm{T}_{\mathrm{e}-1}}^{\mathrm{T}_{\mathrm{e}}+\mathrm{s}} \mathrm{AR}_{\text {ite }} \text { for } \mathrm{s}=\{1,3,5,7,10\}
$$

## Research Design - Step 2

- Use $\mathrm{CAR}_{\text {ies }}$ to learn about its responses to changes in direct and indirect "trade-war" tariff changes.
$\mathrm{CAR}_{\text {ies }}=$ DirectTariff $_{\text {ies }} \boldsymbol{\gamma}+$ IndirectTariff $_{\text {ies }} \delta+$
$\zeta$ Market $^{\text {Cap }}{ }_{i}+$ Controls $_{\text {ies }} \eta+\mathrm{FE}_{\text {country }}$ (i), $+\mathrm{FE}_{\text {sector(i), }}+\mathrm{u}_{\text {ies }}$.
- Use a vector with four elements regarding direct tariff changes associated with actions of the U.S. and China, respectively:
DirectTariff=(DirectTariff USA,USA , DirectTariff $_{\text {USA,CHN }}$, DirectTariff $_{\text {CHN,USA }}$, DirectTariff ${ }_{\mathrm{CHN}, \mathrm{CHN}}$ )
- The tariffs are weighted by the operating income in up to 10 sectors reported in the firm data.

## Research Design - Step 2

- Indirect effects of tariff changes which depend on an economy's "position" in the input-use-related world-inputoutput network:

$$
\text { IndirectTariff=(IndirectTariff }_{\text {USA }} \text {, IndirectTariff }{ }_{\text {CHN }} \text { ) }
$$

- Define (row-normalized) matrix W based on the WIOD international input-output matrix of 2011 (released in 2013).

Rows are users and columns makers.

- Overall size of $\mathbf{W}$ is $1200 \times 1200$ ( 40 countries and 30 aggregated sectors in WIOD).

## Research Design - Step 2

- I: $1200 \times 1200$ identity matrix.
- $\mathbf{D}_{\text {USA }}$ and $\mathbf{D}_{\text {CHN }}: 30 \times 1$ vectors of tariff changes in U.S. and in China for a generic event, resp.
- $\mathrm{J}_{\text {USA }}$ and $\mathrm{J}_{\text {CHN }}$ : $1200 \times 1$ vectors of all zeros except for elements of $\mathbf{D}_{\text {USA }}$ and $\mathbf{D}_{\text {CHN }}$ in the $30 \times 1$ row blocks pertaining to the U.S. and China, resp.
- $\mathbf{R}=(\mathbf{I}-\mathbf{W})^{-1}$ (Leontief-type inverse) $=\mathbf{I}+\sum_{p=1}^{\infty} \mathbf{W}^{p}$
- Indirect effects of the tariff changes of the U.S. and China: $(R-I) J_{U S A}$ and $(R-I) J_{C H N}$, resp.

## Data

Include data on all 40 economies covered by WIOD in our analysis.

- Direct parties to the "trade war" (2):

China and United States.

- Third parties to the "trade war" (38):

Australia, Austria, Belgium, Brazil, Bulgaria, Canada, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, India, Indonesia, Ireland, Italy, Japan, Latvia, Lithuania, Luxembourg, Malta, Mexico, Netherlands, Poland, Portugal, Romania, Russia, Slovenia, Slovak Republic, South Korea, Spain, Sweden, Taiwan, Turkey, and United Kingdom.

## Data

- Stock-market data: daily data on active companies listed on local stock exchanges in a window of days around each US-China "trade-war" tariff-announcement or implementation event from Datastream for the aforementioned economies.
- Consider 19 event dates in this estimation including: Year 2018: March 29, April 2, 3, and 4, June 15 and 16, July 6 and 10, August 1, 3, 7, 8, and 23, September 18 and 24, December 14.
Year 2019: May 5, 10, and 13.

## Data

- Final sample used in first-step and second-step regressions includes $\mathbf{3 1 , 2 1 7}$ firms yielding 543,304 observations across all events covered.

## Data

- "Trade-war" tariff-change data: Obtain the lists of products on which "trade-war" tariffs were announced or imposed for each event from each country's official websites.
- HTS codes $\rightarrow 6$-digit HS2017 codes $\rightarrow 5$-digit STIC rev. $3 \rightarrow$ ISIC rev. 3 4-digit codes $\rightarrow$ ISIC rev. 3 2-digit codes (used by WIOD).

## Summary of Table 3

Observation 1: On average, trade-war tariffs of the U.S. and China directly hurt targeted firms/sectors abroad as intended (i.e., U.S. tariffs hurt Chinese firms and vice versa) but also ones at home (i.e., U.S. tariffs hurt U.S. firms in the same sector and similarly for China).

## Summary of Table 3

[^0]
## Summary of Table 3 Cont'd

Observation 2: There was retaliation about almost any actions by the U.S. and China, and we saw from before that direct effects on foreign parties were negative. Expected retaliation (or expected value-chain effects) on U.S harmed U.S. firms, and retaliation on China harmed Chinese firms.

Source: https://www.right-mind.us/trade-wars-are-easy-to-win//

## Summary of Table 3 Cont'd

Observation 3: The global-value-chain-mediated indirect effects of the U.S.-China "trade-war" tariffs were positive or negative, depending on a sector and economy's position in the global value chain.

## Summary statistics of the predicted tariff effects in \%

Full sample (daily firm/stock micro data).

| Variable | No. of obs. | Mean | Min | P25 | P50 | P75 | Max |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| $\hat{\delta}_{1}$ IndirectTariff $_{\text {USA }}$ | 317,812 | 0.0026 | -1.5444 | 0.0000 | 0.0001 | 0.0009 | 2.5658 |
| $\hat{\delta}_{2}$ IndirectTariff $_{\text {CHN }}$ | 335,495 | 0.0005 | -1.0750 | 0.0000 | 0.0000 | 0.0001 | 11.6309 |

## Summary of Previous Table

Observation 4: On average, the direct effects on firms in the U.S. are the largest, and the indirect effects induced by tariff changes of the U.S. are much larger than those of China.

## Sector-level Results: Direct Effects on Firms (\%)

(a) U.S. tariff effects on U.S.firms

(c) Chinese tariff effects on Chinese firms

(b) U.S. tariff effects on Chinese firms

(d) Chinese tariff effects on U.S.firms

## Sector-level Results: Indirect Effects on Firms (\%)

## Summary of Previous Two Figures

Observation 5: Direct effects (sector-level parameters x tariff changes) on stock-market returns in percent vary to a large extent. Direct effects tend to be negative. Nontrivial mass of «own» effects are negative (U.S. on U.S. even more so than China on China).

## Summary of Previous Two Figures Cont'd

Observation 6: Indirect effects (sector-level parameters $x$ tariff changes) on stock-market returns in percent also vary largely but somewhat less than direct ones.
Large mass of indirect effects is also negative.
Clear that global value chains affect trade-war effects.

## Conclusions

Actions by U.S. and China hurt stock prices on average not only in targeted countries but also at home.

They indirectly affect stock prices through global value-chain linkages in the U.S., China, and in third economies, which do not directly participate in the "trade war", as well as in untargeted sectors.

Our analysis is systematic but it has its limitations:

- relatively short-run reactions at stock markets;
- many interesting margins of economic activity (employment, investment, firm entry, trade, etc.) cannot yet be addressed.

Thank you for your attention!
